MY TAILOR & FABRICS

Business Management System

Product Requirements Document

Version 2.0 · Updated · All Decisions Locked · 2025

Business & Product Edition — Plain English, No Code

Property	Details
Business Name	My Tailor & Fabrics
Business Type	Custom Garment Stitching Shop
Team Size	24+ Employees (tailors, staff, management)
Branches	Current: 1 branch. Target: 2–3 branches within the year
Document Type	Product Requirements — Business Edition (plain language, no code)
Companion Doc	TBMS PRD v2.1 FINAL — full technical spec for developers
Version	v2.0 — Full rewrite incorporating all finalized decisions
Status	FINAL — all 8 architectural decisions resolved, zero open questions
Money Rule	All money stored in system as whole numbers (paisas). Rs 1,500 = 150,000 paisas. Display always shows Rs format.

1. Business Overview & Problem Statement

1.1 About the Business

My Tailor & Fabrics is a tailoring shop specialising in custom-stitched garments including Shalwar Kameez, 2-Piece Suits, 3-Piece Suits, Waistcoats, Coats, and other garment types. The shop employs 24+ tailors and staff across one location, with plans to expand to 2–3 branches.

Currently, the shop manages all operations manually — order slips, handwritten customer measurements, paper-based employee tracking, and verbal or cash-in-hand payment handling. This works at small scale but creates serious problems as the business grows.

1.2 Current Problems

- **Customer measurements are written on paper slips and are frequently lost, hard to find, or illegible**
- No fast way to look up a customer — staff have to search through stacks of paper
- No visibility into which tailor is working on which order or whether it will be ready on time
- Employee payments are calculated manually and are error-prone — disputes arise frequently
- Owner has no clear picture of how much revenue came in, what expenses went out, or what profit was made in a given month
- As the business grows to multiple branches, managing everything manually becomes impossible

1.3 Solution

What We Are Building

A web-based management system that centralises all operations of My Tailor & Fabrics. Every customer, order, employee, measurement, payment, and expense will be tracked digitally in one place — accessible from any device, from any branch.

The system is designed to grow with the business:

· Start with 1 branch today
· Add 2nd and 3rd branches without any changes to the system
· Handle 100+ employees and thousands of orders without slowing down

2. System Summary — What We Are Building

2.1 The 7 Modules

#	Module	What It Does
1	Admin Configuration	Owner/manager sets up garment types, prices, measurement templates. These flow into all other modules.
2	Employee Management	Complete employee profiles, documents, work history, and login accounts for tailors.
3	Customer Management	Customer profiles with unique Size Numbers and full measurement records per garment type.
4	Order Management	Create orders, assign items to tailors, track status, record payments, generate receipts.
5	Payment Module	Calculate what each tailor has earned, disburse payments, show weekly balance summaries.
6	Expense Tracker	Log all business expenses (rent, electricity, equipment) with categories and receipts.
7	Dashboard & Reports	Visual overview of the business — revenue, expenses, orders, employee productivity.

2.2 Key Design Principles

- **Branch-aware from day one — every record knows which branch it belongs to. Adding new branches requires zero rebuilding.**
- **Config-driven — garment types, prices, and measurement fields are set by the admin at runtime, not hardcoded. The business can change them anytime.**
- **Search-first — finding a customer or employee takes less than 1 second, even with thousands of records.**
- **Everything is audited — every action (create, edit, delete, payment) is logged with who did it and when.**
- **Nothing is permanently deleted — records are archived, never destroyed. Full history always preserved.**

2.3 Technology (Plain English)

The system is a web application — it runs in a browser, on any device (laptop, phone, tablet). There is no software to install. It is built on modern, industry-standard technology chosen for speed, reliability, and the ability to scale to multiple branches without rebuilding.

Layer	Technology	Why
Website (what staff see)	Next.js + TypeScript	Fast, modern web framework used by major companies worldwide

Layer	Technology	Why
Visual design	Tailwind CSS + shadcn/ui	Clean, professional, consistent interface
Backend (the brain)	NestJS + TypeScript	Structured, reliable server that handles all business logic
Database (the memory)	PostgreSQL on Neon	Managed, automatically backed up, point-in-time restore
Speed cache	Redis on Upstash	Makes search results nearly instant
File storage	Cloudflare R2	Stores employee documents and receipt photos securely

3. User Roles — Who Uses the System

The system has 5 distinct roles. Each role sees only what it needs to see. This protects sensitive data and prevents mistakes.

Role	Who	What They Can Do	What They Cannot Do
Super Admin	Business Owner	Everything — all branches, all data, all settings, all deletions, all reports	Nothing is hidden from Super Admin
Admin	Branch Manager	Manage employees & customers, create orders, process payments, view reports, configure prices and garment types	Cannot manage other users or create new branches
Entry Operator	Front-desk staff	Create and edit customers and orders, record advance payments from customers	Cannot delete records, cannot disburse employee payments, cannot change prices
Viewer	Accountant / read-only	View all orders, reports, payment history, and dashboards	Cannot create, edit, or delete anything
Employee	Tailor (the stitcher)	View own assigned order items, own earnings, own payment history, own profile	Cannot see any other employee's data, cannot see customer prices, cannot see customer contact details

Important — Employee Role

Tailors get their own login. When they log in they see:

- A list of garment items assigned to them (garment type, description, due date, status)
- Their own earnings (what they earn per piece — NOT what the shop charges the customer)
- Their own payment history (what has been paid to them so far)

Tailors do NOT see: customer names, phone numbers, addresses, customer prices, or any other employee's information. This is enforced at the system level — not just hidden.

4. Module 1 — Admin Configuration Panel

The Admin Configuration Panel is the starting point for everything. Before the system can be used for orders or customers, the admin sets up the building blocks here. All options that appear elsewhere in the system come from this panel — meaning the business can customise everything without touching any code.

4.1 Garment Type Management

Admin creates and manages the types of garments the shop stitches. These appear in the order form when staff add items to an order.

Two Prices Per Garment Type — Locked Decision

Every garment type has TWO prices set by the admin:

Customer Price — what the shop charges the customer for this garment.
Example: Shalwar Kameez = Rs. 1,500

Employee Rate — what the assigned tailor earns for completing this garment.
Example: Shalwar Kameez tailor earns Rs. 400 per piece

These two numbers are completely independent. The customer never sees the employee rate. The employee never sees the customer price.

IMPORTANT: When an order is created, both prices are locked onto that order at that moment. If the admin later changes the prices, old orders are NEVER affected. This is by design.

What Admin Can Set Per Garment Type

- Name (e.g. Shalwar Kameez, 3-Piece Suit, Waistcoat, Coat, Trouser, Kurta, etc.)
- Customer Price — what the shop charges (in Rs.)
- Employee Rate — what the tailor earns per completed piece (in Rs.)
- Description / notes (optional)
- Sort order — controls the display order in the order form
- Active / Inactive — inactive types disappear from the order form without being deleted

4.2 Branch Price Overrides

Locked Decision — Branch Pricing

Global Default + Branch Override model.

Each garment type has a global default price that applies to all branches.
An individual branch can set its own customer price and/or employee rate that overrides the global default for that branch only.

Example:
Global: Shalwar Kameez customer price = Rs. 1,500
Lahore branch: override = Rs. 1,800 (higher-end market)
Karachi branch: no override, uses global Rs. 1,500

When creating an order, the system automatically uses the branch's override if one exists, otherwise falls back to the global price.

4.3 Measurement Category Management

Admin defines measurement templates for different garment types. These templates control which fields appear when recording a customer's measurements.

How It Works

Admin creates a category (e.g. 'Shalwar Kameez') and adds fields to it:
Shoulder, Chest, Waist, Hips, Sleeve Length, Shirt Length,
Trouser Length, Trouser Width, Collar Size

Admin creates another category (e.g. 'Coat / Blazer') with different fields:
Chest, Shoulder, Sleeve, Back Length, Collar, Button Position

When a staff member opens a customer profile and adds measurements, they select the category first — then only that category's fields appear.
A customer can have measurements stored for multiple categories simultaneously.

- Admin can add unlimited categories with unlimited fields
- Field types: Number (with optional unit like inches/cm), Text, or Dropdown (with options)
- Fields can be marked Required or Optional
- Fields can be reordered by drag-and-drop
- Inactive categories no longer appear in customer profiles but existing records are kept

4.4 Expense Categories

Admin manages the list of business expense categories. These appear when logging expenses in the Expense Tracker module.

- Shop Rent
- Electricity & Utilities
- Equipment Purchase or Repair (machines, needles, scissors)
- Staff Salaries (fixed-wage staff)
- Raw Materials / Supplies
- Transport & Delivery
- Miscellaneous
- Admin can add, edit, or deactivate categories at any time

4.5 User Account Management

Super Admin can create, edit, deactivate, and manage all user accounts across all branches. Admin can create Entry Operator and Viewer accounts within their branch, and can create Employee login accounts for their tailors.

Who Can Create	Account Types They Can Create
Super Admin	Super Admin, Admin, Entry Operator, Viewer, Employee — for any branch
Admin	Entry Operator, Viewer, Employee — for their own branch only
Entry Operator, Viewer, Employee	Cannot create any user accounts

5. Module 2 — Employee Management

Every tailor and staff member has a full digital profile in the system. This module covers everything from personal information to documents, work history, and payment records.

5.1 Employee Profile — What Is Stored

Section	Fields
Identity	Full Name, Father's Name, Date of Birth, Gender, Profile Photo
Contact	Primary Phone, Secondary Phone, Home Address, City
Employment	Employee Code (auto-generated, e.g. EMP-LHR-0001), Branch, Date of Joining, Designation, Employment Status (Active / Inactive / Left)
Payment Settings	Payment Type (Per-Piece or Weekly Fixed), Bank Account / JazzCash / EasyPaisa number
Identity Documents	CNIC Number (unique, required for payroll compliance)
Emergency Contact	Name, Relationship, Phone Number
Notes	Admin notes — special instructions, preferences, any relevant information

5.2 Employee Documents

Admins can upload and securely store documents for each employee. All files are stored in private cloud storage and are only accessible through the system.

- CNIC scan (front and back)
- Employment contract or agreement
- Any other documents (references, certificates, etc.)
- Each document shows: file name, upload date, uploaded by
- Admin+ can upload or delete documents

5.3 Employee Login Account

Every employee (tailor) can optionally be given a login account. This is created by Admin and linked to their employee profile.

What the Employee Sees When They Log In

My Orders — list of garment items currently assigned to them
Shows: garment type, order description, due date, current status
Does NOT show: customer name, customer phone, customer price

My Earnings — their current balance (total earned minus total paid out)
Shows their employee rate per piece — NOT the customer price

My Profile — their own profile information (read-only)

They cannot access any other employee's data, any customer data,
any pricing information beyond their own rate, or any management screens.

5.4 Employee Work History

The system automatically builds a complete work history for every employee based on order items assigned to them. This is viewable by Admin+ and feeds directly into the Payment Module.

- All garment items ever assigned — with order number, garment type, quantity, status, completion date
- Filter by date range, garment type, or status
- Total units completed all-time and per week
- Total earnings all-time and per week
- Total paid out and current outstanding balance

5.5 Employee Search

The employee list is fully searchable. Staff can search by name, employee code, phone number, CNIC, or designation. Search results appear in under 1 second even with hundreds of employees.

6. Module 3 — Customer Management

Every customer has a permanent digital profile in the system. The most important feature is the Size Number — a unique identifier assigned to each customer that makes finding them in seconds possible, even with thousands of customers in the database.

6.1 The Size Number — Most Important Field

Size Number Design

Every customer gets a unique Size Number automatically assigned when their profile is created.

Format: C-{BranchCode}-{4-digit number}
Examples: C-LHR-0045 (Lahore branch, 45th customer)
C-KHI-0012 (Karachi branch, 12th customer)

This is the FASTEST way to find a customer. Staff often know their customer's size number by heart. Typing 'C-LHR-0045' in the search box immediately shows that customer's full profile.

Once assigned, a Size Number never changes and never gets reused.

6.2 Customer Profile — What Is Stored

Section	Fields
Identity	Size Number (auto-generated, unique), Full Name, Status (Active / Inactive / Blacklisted)
Contact	Phone Number, WhatsApp Number, Email (optional), Address, City
Measurements	Dynamic — one set of measurements per garment category (e.g. separate records for Shalwar Kameez and Coat). Fields depend on what Admin configured.
Notes	Free text — fabric preferences, special requests, VIP status, any relevant information
History	Automatically shows all past and current orders linked to this customer

6.3 Dynamic Measurement System

A customer can have measurements recorded for multiple garment categories. When staff open a customer profile and click 'Add Measurements', they select the category (e.g. Shalwar Kameez) and the correct fields appear automatically based on what the Admin configured.

1. Staff opens customer profile
2. Clicks 'Add Measurement Category'
3. Selects category from dropdown (e.g. 'Shalwar Kameez')

4. All fields for that category appear (Shoulder, Chest, Waist, etc.)
5. Staff fills in the measurements and saves
6. Staff can add another category (e.g. 'Coat') — different fields appear
7. Both sets of measurements now live on the customer profile permanently

6.4 Customer Search

Customers can be found in under 1 second by searching any of the following:

- Size Number (fastest — direct match)
- Full name or partial name
- Phone number
- WhatsApp number
- City

The search box shows a live dropdown of results as you type, starting from the 2nd character. Selecting a customer from the dropdown immediately opens their profile or pre-fills their details in the order form.

7. Module 4 — Order Management

The Order module is the operational core of the system. Every garment job is tracked here from creation to delivery. An order belongs to one customer and can contain multiple different garment items, each assigned to a different tailor.

7.1 Creating an Order — Step by Step

Step	What Happens
Step 1: Find the customer	Staff types the customer's Size Number, name, or phone in the search box. A live dropdown shows matching customers. Staff selects the correct one. Their profile info is shown for confirmation.
Step 2: Set order details	Order date (auto-fills today), Due date (required — when the customer expects delivery), any order-level notes.
Step 3: Add garment items	Staff adds one or more garment items. For each item: select garment type → select employee (tailor) → enter quantity → add description (fabric colour, embroidery notes, button type, etc.) → set item due date if different from order due date.
Step 4: Apply discount	Optional. Staff can apply a fixed amount discount (e.g. Rs. 200 off) or a percentage discount (e.g. 10% off) to the whole order. Only Admin+ can do this.
Step 5: Payment	System shows the full order total. Staff records advance payment if customer has paid any. Remaining balance is shown automatically.
Step 6: Confirm	Staff reviews the full summary and confirms. System generates a unique Order Number automatically.

7.2 Order Pricing & Totals

How Order Totals Are Calculated

Subtotal = Sum of (Customer Price × Quantity) for all non-cancelled items
Discount = Fixed amount OR Percentage of subtotal (Admin sets this per order)
Total = Subtotal minus Discount
Balance Due = Total minus all payments received from customer

Example:
Shalwar Kameez × 2 @ Rs. 1,500 = Rs. 3,000
Waistcoat × 1 @ Rs. 800 = Rs. 800
Subtotal = Rs. 3,800
Discount (10%) = Rs. 380
Total = Rs. 3,420
Advance Paid = Rs. 1,000
Balance Due = Rs. 2,420

7.3 Discount System

Locked Decision — Discounts

Both fixed-amount and percentage discounts are supported on any order.
Only Admin and Super Admin can apply discounts.
Entry Operators cannot apply discounts.

Fixed discount: a specific rupee amount taken off the total (e.g. Rs. 500 off)
Percentage discount: a percentage of the subtotal (e.g. 10% off)

The discount is shown as a separate line on the order and on the printed receipt.
A discount can never make the total go below zero.

7.4 Garment Item Details

Each item within an order tracks the following:

Field	Description
Garment Type	Selected from admin-configured list (e.g. Shalwar Kameez)
Garment Type Name	Saved as a snapshot — won't change even if admin renames the type later
Assigned Employee	The tailor responsible for stitching this item
Quantity	Number of pieces of this garment type
Customer Price	Auto-filled from branch/global price. Visible to staff. Hidden from tailors.
Employee Rate	Auto-filled from branch/global rate. Used to calculate tailor earnings. Hidden from customers.
Description	Free text — fabric colour, embroidery details, button type, lining, any special instructions
Item Due Date	Optional — can differ from the order's overall due date
Status	Pending → In Progress → Completed (or Cancelled)

7.5 Item Completion Rule

Locked Decision — All-or-Nothing Completion

An item with Quantity 3 is either entirely complete or not complete.
There is no 'partially done' status — e.g. you cannot mark 2 of 3 done.

If a customer wants to collect 2 pieces now and 1 piece later,
the staff should create TWO separate line items: one for quantity 2, one for quantity 1.
This keeps the system simple and payment calculations unambiguous.

7.6 Order Status Lifecycle

Status	Meaning	Who Can Set It
New	Order just created, no work started yet	Auto (on creation)
In Progress	At least one item has been assigned to a tailor and work has begun	Entry Operator+
Ready	All items are marked complete — order is ready for collection	Entry Operator+
Overdue	Due date has passed and order is not yet delivered	System (automatic, every hour)
Delivered	Customer has collected their order	Entry Operator+
Completed	Order fully delivered and full payment received	Entry Operator+
Cancelled	Order cancelled — all items marked cancelled, tailors earn nothing	Admin+

7.7 Overdue Orders — Automatic Detection

Locked Decision — Overdue Handling

The system automatically checks orders every hour.
Any order whose due date has passed — and is not yet Delivered, Completed, or Cancelled — is automatically changed to OVERDUE status.

OVERDUE orders are shown with a red badge everywhere in the system.
The dashboard shows a count of overdue orders with a direct link to the list.

Staff can reset an overdue order back to In Progress if they update the due date.
The system logs every automatic status change with 'SYSTEM' as the actor.

7.8 Customer Payments on an Order

Customers often pay in instalments — an advance upfront and the remaining balance on collection. The system tracks all payments against an order.

- Advance payment recorded at order creation time
- Additional payments can be recorded at any time (partial or full remaining balance)
- Every payment records: amount, date, time, received by (which staff member), optional note
- Balance Due always shows the current remaining amount owed
- Full payment history is visible on every order

7.9 Order Search & Filters

- Search by: Order Number, Customer Name, Customer Size Number
- Filter by: Status (New, In Progress, Overdue, etc.), Date range, Branch, Assigned Tailor
- Sort by: Order date, Due date, Total value

- Export filtered list to PDF or Excel

Receipts can be printed or saved as PDF for any order — showing all items, customer prices, discount (if any), total, advance paid, and balance due.

8. Module 5 — Payment Module

The Payment Module handles money flowing from the shop to the tailors. It calculates how much each tailor has earned based on completed work, tracks how much has been paid out, and shows the outstanding balance clearly.

8.1 How Tailor Earnings Are Calculated

Earnings Calculation — Locked Rules

A tailor earns money ONLY when an order item assigned to them reaches COMPLETED or DELIVERED status.

Earning per item = Employee Rate × Quantity
(Rate was set at the time the order was created — never changes)

Total Earned = Sum of all earnings from completed/delivered items
Total Paid = Sum of all disbursements made to this tailor
Current Balance = Total Earned minus Total Paid

CANCELLED items: tailor earns NOTHING.
There are no exceptions — cancelled means zero pay, regardless of how much work was done.
This is a firm business rule with no manual override.

8.2 Payment Disbursement Process

8. Staff opens the Payment Module and searches for the tailor by name or employee code
9. System shows the tailor's full summary: Total Earned, Total Paid, Current Balance
10. Staff enters the disbursement amount (can be any amount up to the current balance)
11. System validates the amount — it cannot exceed the current balance
12. Admin confirms the disbursement
13. Payment is recorded: amount, date, time, processed by (which staff), optional note
14. The tailor's balance updates immediately

8.3 Weekly Balance Summary

The system groups all earnings and payments by week (Monday to Sunday, Pakistan Standard Time). This gives a clear picture of each week's activity.

Field	Description
Week Period	e.g. Mon 14 Oct — Sun 20 Oct 2025
Items Completed	Count of garment items marked complete during this week
Earned This Week	Total earnings from items completed this week

Field	Description
Paid This Week	Total disbursements made to this tailor this week
Closing Balance	Earned this week minus paid this week
Cumulative Balance	Total outstanding balance across all weeks (what is owed to the tailor right now)

The last 8 weeks of breakdown are shown on the payment screen. The weekly payment report (printable) lists all tailors with their week's summary on one page.

8.4 Payment History

- Full payment ledger per tailor — every disbursement ever made
- Filterable by date range
- Shows: date, amount, processed by, notes
- Printable / exportable to PDF or Excel

9. Module 6 — Business Expense Tracker

The Expense Tracker records all money going out of the business that is not tailor payments. This data feeds into the financial dashboard to give the owner a complete picture of the business.

9.1 Logging an Expense

Field	Description
Date	The date the expense was incurred
Branch	Which branch the expense belongs to
Category	Admin-configured category (Rent, Electricity, Equipment, etc.)
Amount	Expense amount in Rs.
Description	Details about the expense (optional but recommended)
Receipt	Photo or PDF upload of the receipt (optional)
Added By	Automatically recorded — which staff member logged this

9.2 What You Can Do

- View all expenses filtered by date range, branch, or category
- See monthly expense totals per category
- Compare expenses month-over-month in the dashboard
- Export expense list to PDF or Excel
- Admin+ can edit or delete expense entries

10. Module 7 — Dashboard & Reports

The Dashboard gives the owner and managers an instant visual overview of the business. All numbers are real-time, filtered to the current branch (or all branches for Super Admin).

10.1 KPI Cards (Top of Dashboard)

Card	What It Shows
Total Orders This Month	Count of orders created in the current calendar month
Revenue This Month	Sum of all order totals for this month (what customers owe/owed)
Payments Received This Month	Actual cash received from customers this month
Employee Disbursements This Month	Total paid out to tailors this month
Outstanding Employee Balances	Total currently owed to all tailors (not yet paid out)
Total Expenses This Month	Sum of all logged business expenses this month
Overdue Orders	Count of orders currently in OVERDUE status — links to filtered list

10.2 Charts & Visuals

Chart	Type	Description
Monthly Revenue vs Expenses	Bar Chart	Side-by-side bars for each month — revenue in blue, expenses in red
Orders by Garment Type	Donut Chart	What percentage of orders are Shalwar Kameez vs Suits vs Waistcoats etc.
Employee Productivity	Horizontal Bar	Items completed per tailor in the selected period
Weekly Disbursements	Line Chart	Trend of payments made to tailors over recent weeks
Order Status Breakdown	Pie Chart	How many orders are New / In Progress / Overdue / Completed
Expense Breakdown	Donut Chart	Expenses split by category (Rent vs Electricity vs Equipment etc.)

10.3 Exportable Reports

- Monthly Revenue Report (PDF or Excel)
- Employee Payment Summary (PDF or Excel) — all tailors, their earnings, paid, balance
- Order Completion Report — orders by status, by garment type, by tailor
- Customer Order History — all orders for a specific customer
- Expense Summary — by category, by month, by branch

- All reports filterable by date range and branch

11. All 8 Architectural Decisions — Locked

These are the 8 key business decisions that were finalised during the requirements process. They are documented here so that every stakeholder and developer has a single reference. None of these should be changed without discussion — they affect the database, calculations, and user experience throughout the system.

Decision 1 — Two Prices Per Garment Type

Each garment type has two independent prices:
Customer Price: what the shop charges the customer
Employee Rate: what the assigned tailor earns per completed piece

These are set by Admin globally, with optional per-branch overrides.
Both prices are snapshot-copied onto each order item at creation.
Price changes by Admin NEVER affect existing orders — only new ones.

Decision 2 — Global Default + Branch Price Override

Garment types have a global customer price and employee rate.
Each branch can override either or both prices independently.
If no branch override is set, the global price is used automatically.

Decision 3 — All-or-Nothing Item Completion

A line item (e.g. Shalwar Kameez × 3) is completed in full or not at all.
No partial quantity completion.
If a split is needed, create separate line items at order entry time.

Decision 4 — Automatic OVERDUE Status

The system checks every hour for orders whose due date has passed.
Qualifying orders are automatically set to OVERDUE status by the system.
The owner/manager sees an OVERDUE count on the dashboard at all times.
Staff can reset an overdue order to In Progress by extending the due date.

Decision 5 — Cancelled Orders = Zero Tailor Pay

If an order is cancelled, all its items are marked cancelled.
Tailors earn NOTHING for cancelled items — regardless of how much work was done.
This is absolute. There is no case-by-case override.
This rule is enforced at the calculation level, not just the display level.

Decision 6 — Both Fixed and Percentage Discounts

Staff (Admin role and above) can apply a discount to any order.
Two types: Fixed amount (e.g. Rs. 500 off) or Percentage (e.g. 10% off).

Only Admin and Super Admin can apply discounts — Entry Operators cannot.
Discount is shown as a separate line on the order and printed receipt.
A discount can never make the total negative.

Decision 7 — Employees Get Their Own Login

Every tailor can be given a login to the system (EMPLOYEE role).
They see: their assigned orders, their earnings, their payment history, their profile.
They do NOT see: customer details, customer prices, other employees' data.
Employee rate (what they earn) is shown. Customer price is always hidden from them.
This is enforced at the system level — it cannot be bypassed.

Decision 8 — Managed Database with Automatic Backups

The database is hosted on a managed service (Neon / Supabase / Railway).
This means automatic daily backups and point-in-time restore capability.
No manual backup management required.
Recommended: Neon — PostgreSQL-native, generous free tier, automatic WAL archiving.
Additional weekly export to cloud storage as extra safety net.

12. Multi-Branch Expansion Plan

The system is designed for multi-branch operation from the very first line of code. Adding a second or third branch does not require rebuilding or restructuring anything.

12.1 How Branch Data Is Isolated

Branch Isolation

Every single record in the system — every customer, employee, order, expense, and payment — is tagged with the branch it belongs to.

When an Admin logs in, they see ONLY their branch's data.
When an Entry Operator searches for a customer, they only see their branch's customers.
When the system calculates payments, it uses that branch's configured rates.

Super Admin (business owner) can see all branches simultaneously, or filter to a specific branch to drill down.

12.2 What Changes When a New Branch Is Added

Item	What Happens
Database	No changes — the system already handles multiple branches
Garment type prices	New branch inherits global prices. Admin can set overrides specific to new branch.
Staff accounts	New accounts are created and assigned to the new branch
Customer records	Customers belong to the branch where they were registered. Size Numbers include branch code.
Reports	Super Admin sees all-branch aggregated reports plus per-branch drill-down
Employee logins	Employees see only their own branch's assigned work

12.3 Branch Setup Process

15. Super Admin creates the new branch (name, address, branch code, phone)
16. Super Admin creates Admin account(s) for the new branch
17. Admin sets up branch-specific price overrides if needed
18. Admin creates employee profiles and user accounts for branch staff
19. Branch is ready to operate — all data isolated from other branches

13. What Was Missing — Gaps Now Resolved

During the requirements process, several important features that were not in the original brief were identified and decided upon. All are now fully specified.

Feature	What It Does	Why It Matters
Two separate prices	Customer Price vs Employee Rate per garment type	Protects tailor rate confidentiality. Allows different margins per garment.
Branch price overrides	Each branch can have different prices than the global default	Enables pricing strategy per market/location
Discount system	Fixed amount or percentage discount on any order (Admin+ only)	Accommodates loyal customer offers and promotions
Overdue automation	System auto-flags orders past their due date every hour	Prevents overdue orders from being forgotten
Cancelled = zero pay rule	Absolute rule: cancelled items never contribute to tailor earnings	Removes ambiguity and disputes around cancellation pay
Employee login	Tailors have their own login to see their assigned work and earnings	Reduces front-desk queries. Gives tailors visibility without access to sensitive data.
Price snapshot on orders	Prices locked at order creation — future price changes don't affect it	Historical order integrity — critical for accounting
Audit log	Every action logged with who did it and when	Accountability, dispute resolution, fraud prevention
Managed DB backups	Automatic daily backups with point-in-time restore	Data safety without manual management
Soft deletes	Nothing is permanently deleted — records are archived	Full history always available. Prevent accidental data loss.
Weekly balance summary	Per-tailor weekly earnings and payment breakdown	Makes weekly pay runs clear and auditable
Order status history	Every status change logged with who changed it and when	Full traceability on every order's journey

14. Development Phases

The system is built and delivered in phases. Each phase is a fully working, usable release. The business can start using Phase 1 while Phase 2 is being built.

Phase 1 — Core Operations (Weeks 1–5)

What You Get

A working system with login, employees, customers (with measurements and search), orders (with assignment and status tracking), and the automatic overdue checker.

- User accounts with all 5 roles and branch isolation
- Admin configuration: garment types (with both prices), branch price overrides, measurement categories
- Employee management: full profiles, documents, employee login accounts
- Customer management: profiles, Size Numbers, dynamic measurements, fast search
- Order management: create orders, add items (with price snapshot), assign tailors, track status
- Discount system: fixed and percentage
- Automatic overdue detection every hour
- Full audit logging

Phase 2 — Financial Layer (Weeks 6–9)

What You Get

The complete money layer — tailor payment disbursements, customer payment tracking, expense logging, and the business dashboard with KPI cards.

- Tailor payment module: balance calculation, weekly breakdown, disbursement
- Customer payment recording per order (advance + remaining)
- Business expense tracker with categories and receipt upload
- Dashboard KPI cards: revenue, expenses, overdue orders, tailor balances
- PDF receipt generation for orders

Phase 3 — Analytics & Polish (Weeks 10–13)

What You Get

Full analytics charts, exportable reports, and a polished, mobile-responsive interface.

- All 6 dashboard charts (revenue vs expenses, garment types, productivity, etc.)
- Weekly payment report — all tailors on one printable page
- PDF and Excel exports for orders, payments, expenses
- Multi-branch dashboard for Super Admin

- Mobile-responsive layout improvements

Phase 4 — Future Expansion (Post-Launch)

Not in initial scope
These features will be added based on real usage and business growth.

- Fabric and raw material inventory tracking
- WhatsApp order status notifications
- Customer order tracking link (shareable)
- Attendance / clock-in for tailors
- Advanced analytics: customer lifetime value, best-selling garment types

15. How to Use This Document with Cursor / AI Agents

This document (Business Edition) and the companion TBMS PRD v2.1 FINAL (Technical Edition) together form your complete specification. Here is how to use them effectively during development.

15.1 Which Document for Which Purpose

Situation	Use This Document
Explaining the system to a non-technical stakeholder	This document (Business PRD v2.0)
Onboarding a new developer or AI agent to the project	TBMS PRD v2.1 FINAL (Technical)
Deciding how a feature should behave	This document — Section 11 (Decisions)
Writing code for a specific module	TBMS PRD v2.1 FINAL — relevant section
Checking what database schema to use	TBMS PRD v2.1 FINAL — Section 3
Understanding what a user role can and cannot do	This document — Section 3, or v2.1 Section 7

15.2 Recommended Cursor Workflow

20. Place both PRD documents in a /docs folder in your project repository
21. Create a .cursorrules file at project root with the key rules (never use floats for money, always soft delete, always scope by branch ID, etc.)
22. For each development session, start with the prompt template from Section 12 of the Technical PRD
23. Reference the relevant section of the Technical PRD in each prompt using @docs/
24. After each session: test the critical cases from Section 11 of the Technical PRD before starting the next session
25. Keep a PROGRESS.md file tracking which sessions are done and which are next

15.3 The .cursorrules Golden Rules

Always Include These Rules in .cursorrules

· All money is stored as INTEGER PAISAS. Rs 1,500 = 150000. Never use floats for money.
· Soft deletes only. All queries must filter: deletedAt IS NULL. Never hard delete.
· All queries must scope by branchId unless the user role is SUPER_ADMIN.
· Price snapshot: copy unitPrice + employeeRate onto OrderItem at creation time.
· EMPLOYEE role must never see unitPrice (customer price) — only their employeeRate.
· Cancelled items never count toward employee earnings. Enforced at DB query level.
· TypeScript strict mode. No 'any' types anywhere.

· All monetary display uses the formatPKR() utility function.

16. Glossary

Term	Plain English Definition
Size Number	A unique code assigned to each customer (e.g. C-LHR-0045). The fastest way to look up a customer. Never changes.
Customer Price	What the shop charges the customer for a garment. Set by Admin. Hidden from tailors.
Employee Rate	What the tailor earns for completing one piece of a garment. Set by Admin. Hidden from customers.
Price Snapshot	When an order is created, both prices are saved onto the order permanently. Future price changes don't affect old orders.
Paisas	1/100 of a Pakistani Rupee. The system stores all money as whole-number paisas internally to avoid calculation errors. Rs 1,500 = 150,000 paisas.
Soft Delete	Instead of permanently removing a record, the system marks it as deleted with a timestamp. The record is hidden but the data is never lost.
Branch Scope	Every piece of data belongs to a branch. Users only see data from their own branch (except Super Admin who sees all).
Audit Log	An automatic record of every action taken in the system: who did it, what they did, when, and what changed.
Garment Type	An admin-configured category of stitching work (e.g. Shalwar Kameez, 3-Piece Suit, Waistcoat).
Line Item	One garment entry within an order. An order can have many line items of different types.
Balance Due	The remaining amount a customer owes on an order: Total minus all payments received so far.
Tailor Balance	The amount currently owed to a tailor: Total earned (from completed items) minus total paid out.
OVERDUE	An order status automatically assigned by the system when a due date passes without delivery.
TBMS	Tailoring Business Management System — the name of this software.
Super Admin	The business owner's role. Has access to everything across all branches.
Entry Operator	Front-desk staff role. Can create and edit customers and orders. Cannot delete or manage payments.
tsvector / GIN	Technical terms for how the search engine works inside the database. Makes search nearly instant.
Neon / Supabase	Managed database hosting services. They handle backups and maintenance automatically.

Document Sign-Off

Role	Name	Date	Signature
Business Owner / Super Admin	_____	_____	_____
Lead Developer	_____	_____	_____
Branch Manager	_____	_____	_____

Version	Date	Changes
v1.0	2025	Initial PRD — high-level requirements document
v2.0	2025	Full rewrite — all 8 decisions locked, schema changes synced (EMPLOYEE role, discounts, branch pricing, price snapshots), Cursor usage guide added, glossary expanded
